

AI Research Report

Based on the research text provided, here is a structured summary of the core pillars of **Biology**:

Core Pillars of Biology

Biology functions as a multidisciplinary study of life, categorized by the following investigative areas:

- * **Structure & Function:** Analysis of how organisms are built (anatomy/morphology) and the internal processes that sustain life (physiology).

- * **Growth & Development:** The study of how organisms progress from inception through their life cycles.

- * **Origins:** Investigating the history and emergence of life on Earth (evolutionary biology and abiogenesis).

- * **Evolution:** The study of how populations change over generations through mechanisms like natural selection and genetic drift.

- * **Distribution:** The examination of where organisms live, why they inhabit specific environments (biogeography), and how they interact with their surroundings.

Note: As this summary covers the broad scope of the discipline, please let me know if you would like me to expand on any of these specific sub-fields (e.g., molecular biology, ecology, or genetics).
